題目說明： The Babylonian algorithm to compute the square root of a positive number n is as follows:

1. Make a guess at the answer (you can pick $n/2$ as your initial guess).
2. Compute $r = n / \text{guess}$.
3. Set $\text{guess} = (\text{guess} + r) / 2$.
4. Go back to step 2 for as many iterations as necessary. The more steps 2 and 3 are repeated, the closer guess will become to the square root of n .

Write a program that inputs a double for n , iterates through the Babylonian algorithm until the guess is within 1% of the previous guess, and outputs the answer as a double to two decimal places. Your answer should be accurate even for large values of n .
